

OEM Simulation

A CAD/CAM solution that lasts!

cncCUT Simulation As An OEM Solution

cncCUT is optimized for use on your CNC panel, and can be installed on and completely integrated with your panel. Many machine manufacturers already employ *cncCUT* as their CNC control panel's CAM component. Many smaller control panel or tool manufacturers have neither their own simulation software nor the spare resources to develop one. Our product offers a ready-made solution; and on top of the other advantages of employing *cncCUT* on your CNC panel, you can also integrate our simulation module.

Your Advantages Summarized:

- Intuitive usability.
- Restart at any position.
- Communicate directly with a CNC panel.
- *cncCUT*'s simulation module shows the machine's idle paths on screen.

Intuitive Usability

All new products from IBE Software focus on our new usability principle, especially *cncCUT* and its associated product line. Our software is self-explanatory and intuitively useable, reducing training requirements for your service technicians and customers. Your service team can combine instruction in the use of our software with installation of your machine, so you deliver everything from a single source.

Restart At Any Position

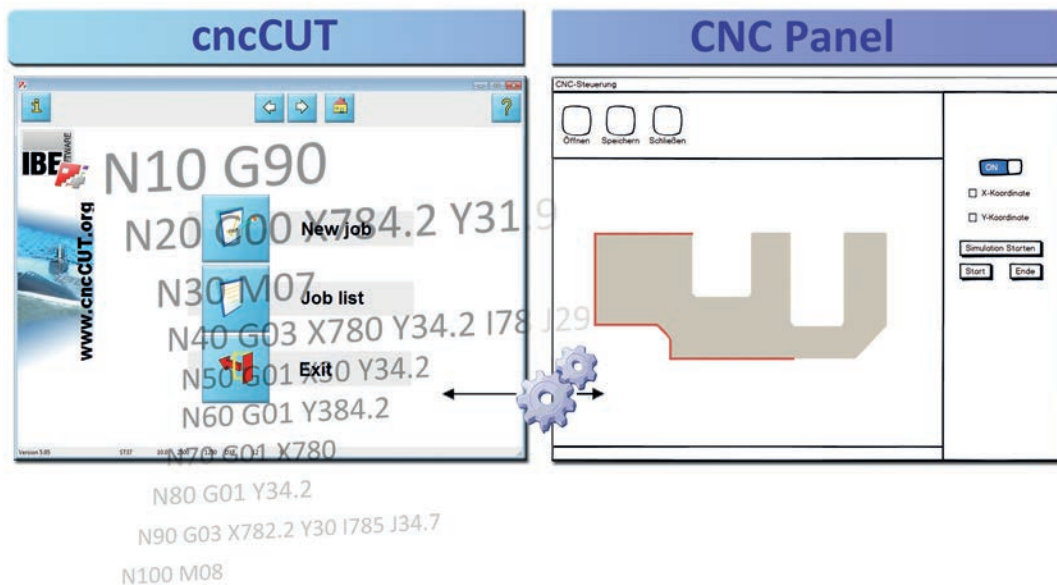

There was never a problem, so long as a CNC program can be processed completely in one run. However, if a production error does occur then the panel must be able to restart at a given position and continue, or you'll need to rerun the whole CNC program. Not all panels are capable of finding the relevant position. With well thought-out adaptations, *cncCUT*'s simulation module can be used thusly on your panel.

Visual Customizability

cncCUT can be individualized; your end-user receives his machine and software package exclusively from you. Leverage our technical competence and know-how to further boost your **Corporate Identity**.

Requirements:

- Adaptation of the simulation module.
- Communication between control panel and **cncCUT**.
- Transmission of X/Y coordinates to **cncCUT**.
